1. Use Case Diagram

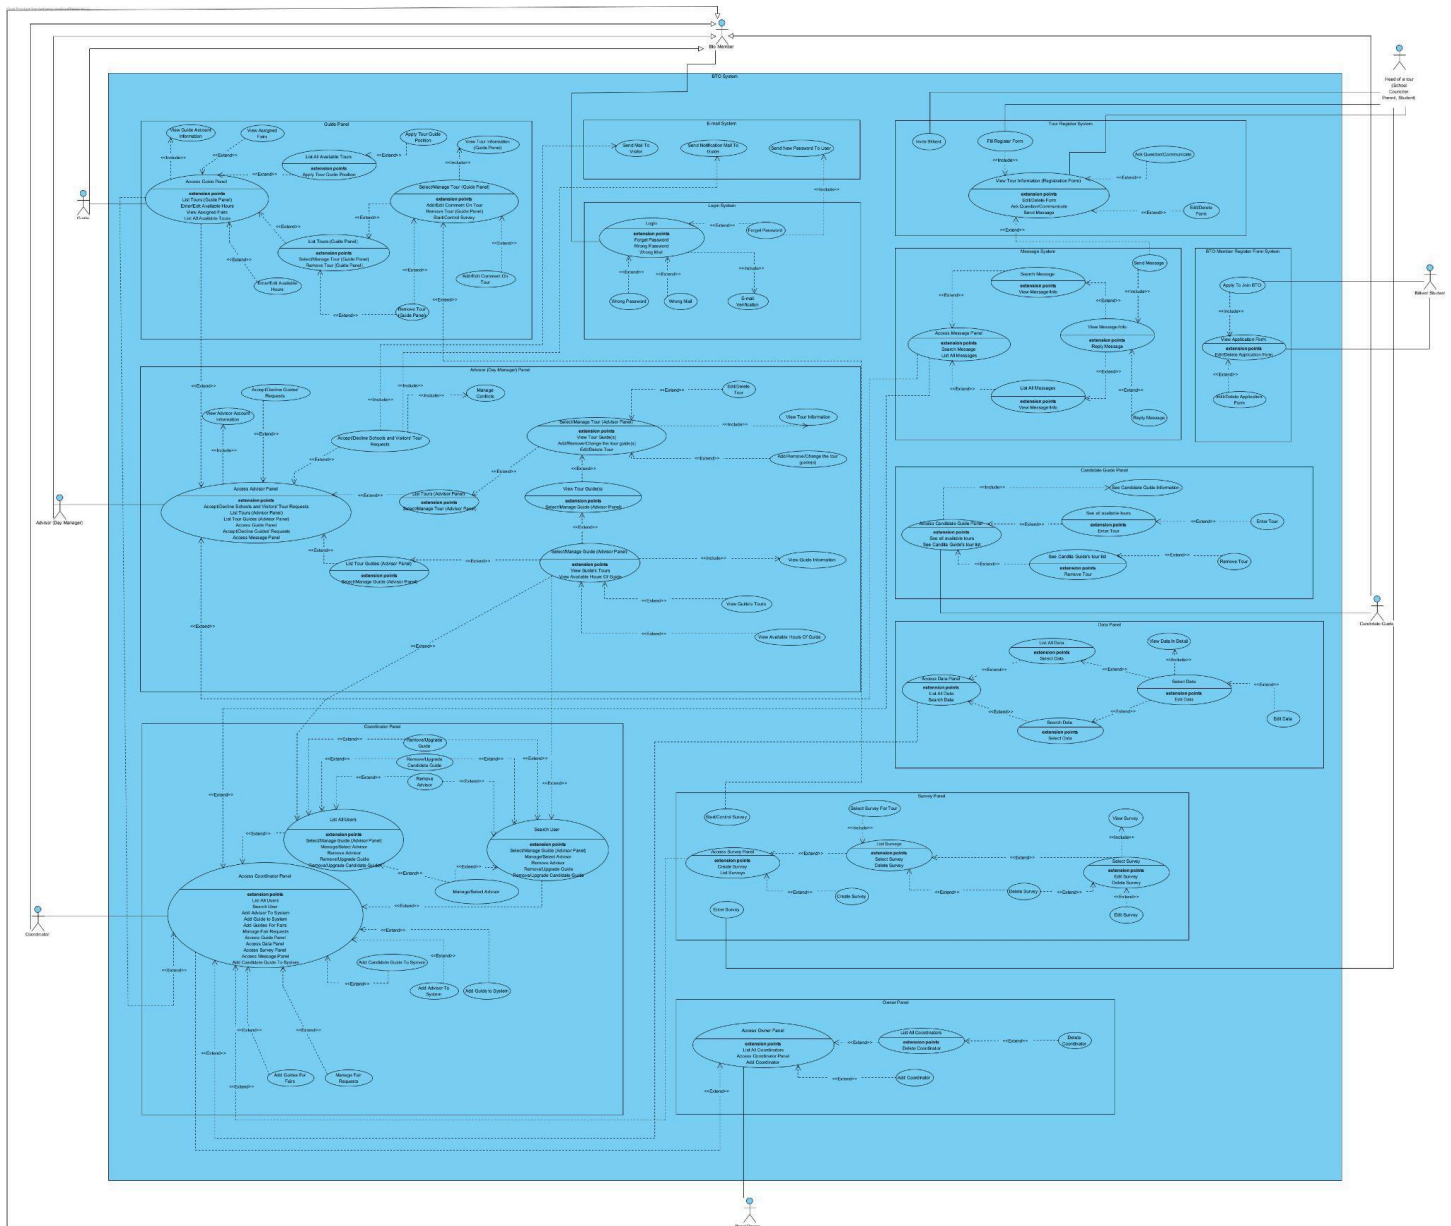

Figure 1: The Use Case Diagram of the Project

2. Use Case Diagram Textual Descriptions

1. Name: Invite Bilkent
2. Participating Actor: Head of a Tour
3. Entry Condition: Entering the website with a web browser, then pressing invite Bilkent button
4. Exit Condition: Pressing the exit button on the page
5. Flow of Events:
 - 5.1. The user presses the invite Bilkent button
 - 5.2. User confirms that he/she is a highschool coordinator

5.3. After the confirmation the user is informed whether the action was successful

1. Name: Fill Register Form
 2. Participating Actor: Head of a Tour
 3. Entry Condition: Entering the website with a web browser, then pressing fill register form button
 4. Exit Condition: Pressing the exit button on the page
 5. Flow of Events:
 - 5.1. The user presses the fill register form button
 - 5.2. User fills the displayed registration form, according to the purpose and features of the tour
 - 5.3. User selects an appropriate date and time from the displayed table for the tour
 - 5.4. After confirming the tour application, a code will be sent to the user's mail, in order for the user to manage, edit and cancel the tour
 - 5.5. The user will be notified whether the action was successful
-
1. Name: View Tour Information
 2. Participating Actor: Head of a Tour
 3. Entry Condition: Entering the website with a web browser, having filled a registration form and receiving a code, pressing the view tour information button
 4. Exit Condition: Pressing the exit button on the page or canceling the tour
 5. Flow of Events:
 - 5.1. The user will enter the code of the tour to the displayed text box
 - 5.2. If the code is invalid
 - 5.2.1. The user will be given an error
 - 5.3. If the code matches successfully
 - 5.3.1. User's tour information will be displayed on the page
 - 5.3.2. The user will be able to ask questions to the advisors and edit or cancel the tour
 - 5.3.3. If the user presses cancel button
 - 5.3.3.1. The tour will be canceled, the user will be notified and directed to the previous screen
-
1. Name: Ask Questions
 2. Participating Actor: Head of a Tour
 3. Entry Condition: Entering the website with a web browser, having filled a registration form and received a code, pressing the view tour information -> ask questions button
 4. Exit Condition: Pressing the exit button on the page
 5. Flow of Events:
 - 5.1. The user presses the ask questions button
 - 5.2. The page will allow users to view and reply messages
 - 5.3. If user presses reply message
 - 5.3.1. A text box will appear where user can reply a specific message
-
1. Name: Access to Guide Panel
 2. Participating Actor: Guide
 3. Entry Condition: Entering the website and logging in with a password

4. Exit Condition: Login process fails or returning to the main page
 5. Flow of Events:
 - 5.1. The user presses the login button
 - 5.2. The user fills the email and password sections
 - 5.3. If the user enters a section incorrectly
 - 5.3.1. Error message is displayed accordingly
 - 5.4. Else if the user presses forgot password button
 - 5.4.1. The user will be sent an email about new password
 - 5.5. Else the user logs in successfully
 - 5.5.1. Capabilities of the guide is displayed
-
1. Name: View Assigned Fairs
 2. Participating Actor: Guide
 3. Entry Condition: The guide should be logged in to the guide panel and press the view fairs button
 4. Exit Condition: Pressing the exit button on the page
 5. Flow of Events:
 - 5.1. The guide presses the view fairs button on the guide panel
 - 5.2. The guide views the fairs which are assigned by the coordinator
-
1. Name: List All Available Tours
 2. Participating Actor: Guide
 3. Entry Condition: The guide should be logged in the guide panel and press the list all available tours button
 4. Exit Condition: Pressing the exit button on the page
 5. Flow of Events:
 - 5.1. The guide presses the list all available tours button on the guide panel
 - 5.2. The guide can apply for a tour from the displayed table
 - 5.2.1. The guide presses the apply button
 - 5.2.2. A message is displayed whether the action was successful
-
1. Name: Enter/Edit Available Hours
 2. Participating Actor: Guide
 3. Entry Condition: The guide should be logged in the guide panel and press the enter/edit available hours button
 4. Exit Condition: Pressing the exit button on the page
 5. Flow of Events:
 - 5.1. The guide presses the edit available hours button on the guide panel
 - 5.2. The guide selects his/her available hours from the displayed table
-
1. Name: List Guide's Tours
 2. Participating Actor: Guide
 3. Entry Condition: The guide should be logged in the guide panel and press the list guide's tours button
 4. Exit Condition: Pressing the exit button on the page

 - 5.4 If owner clicks on the cancel button
 - 5.4 Canceling the action closes the pop-up and shows the list of coordinators

1. Name: Access Data Panel
2. Actor: Coordinator, Owner
3. Entry Condition: Pressing the "Access Data Panel" button on the user's panel
4. Exit Condition: Returning the return to home page button
5. Flow of Events:
 - 5.1. The user presses the "Access Data Panel" on their panel
 - 5.2. The Data Panel is shown

1. Name: List All Data
2. Actor: Coordinator, Owner

3. Entry Condition: Pressing the “List All Data” button on the Data Panel page
4. Exit Condition: Returning to the home page or returning to the Data Panel
5. Flow of Events:
 - 5.1. The user presses the “List All Data” button to view the list of all available data
 - 5.2. The user can press the “Select Data” button to view the data in detail
 - 5.2.1. The user can press the “Edit Data” button to edit the selected data
 - 5.2.2. The user can press the “Remove Data” button to remove the selected data

1. Name: Search Data
2. Actor: Coordinator, Owner
3. Entry Condition: Pressing the “Search Data” button on the Data Panel page
4. Exit Condition: Returning to the home page or returning to the Data Panel
5. Flow of Events:
 - 5.1. The user enters keywords regarding the data they want to search
 - 5.2. If the keywords match
 - 5.2.1. The “Select Data” view of the searched data is shown to the user
 - 5.2.1.1. They can Edit and Remove the selected data
 - 5.2.1.2. They can view detailed information about the selected data
 - 5.3. Else the keywords do not match
 - 5.3.1. Corresponding error message is shown to the user

1. Name: Apply to join BTO
2. Actor: Bilkent Student
3. Entry Condition: Entering the website with a web browser, then pressing apply to join BTO button
4. Exit Condition: Pressing the exit button on the page
5. Flow of Events:
 - 5.1. After pressing the button, an application form will appear on the screen
 - 5.2. If the student fills all of the application form, send button will appear on the screen
 - 5.3. Student will be notified about whether the process was successful
 - 5.4. Student can also view application form with an user-specific distinction mechanism

1. Name: Edit/Delete Application Form
2. Actor: Bilkent Student
3. Entry Condition: Entering the website with a web browser, then pressing apply to join BTO -> view application form -> edit/delete application form button
4. Exit Condition: Pressing the exit button on the page, deleting the form
5. Flow of Events:
 - 5.1. After pressing the edit/delete button an interface will appear in order to manage the previous application form of the user
 - 5.2. The student can change the contents and delete the form entirely in this page
 - 5.3. If student deletes the form
 - 5.3.1. The form will be deleted permanently, and the student will be notified and directed to the previous screen

3. Tech Stack

3.1 ASP.NET

ASP.net core is an open-source, cross-platform backend framework that uses C#. It is fast and efficient, and it offers a secure environment against security breaches and cyber attacks. Moreover; it is easy to use, flexible while also being scalable for large applications. It also has many tools to simplify the developing process such as APIs, plugins, libraries with a built-in package manager called NuGet, garbage collector and a well structured architecture to ease the process of communication [1].

The biggest reason to use ASP.net core is to use the C# language. C# offers an easy to use experience and is highly functional with high efficiency. There are dozens of practical pre-existing libraries and it is full of useful features (async/await, string interpolations, tuples etc.) and especially considering we will constantly be dealing with lots of data, linq will be a useful feature to easily manipulate the data we have very efficiently. C# programs serve many functionalities for well structured and maintainable code with its getter/setters, nullable types, interfaces and many more. C# is also designed to be easy to read, which is important for a group project.

While ASP.net is on the more niche side on the scale of backend development, there isn't a lack of documentation or resources. It still has active and stable support, a massive community with a large ecosystem and 6% of the websites worldwide are using it.

3.2 React.js

React is a widely used frontend framework that uses Javascript as the programming language. It is used in nearly 40% of web applications hosted today with main examples being Netflix, WhatsApp, Facebook and Twitter. This wide and common use range enables the framework to be flexible for any use case and be greatly documented. Both Javascript and React are also popular in unofficial work spaces which enhances the available online resources. The documentation, tutorial and online forum count is important in bug fixing and implementation as errors are bound to occur. React also offers JSX where you can define Javascript utilities such as variables as HTML which not only introduces flexibility but also easiness in coding. We have chosen React for our frontend framework because it's easy to learn, well documented and easy to work with nature [2].

3.3 PostgreSQL

PostgreSQL is an open source database with a huge community supporting it. There is a wide range of documentation available on the internet alongside many useful resources.

PostgreSQL prioritizes security and reliability, and it is optional for people who want to manage the data and have full control over it, without worrying about background problems like data loss, conflicts or leaks. So we can focus only on the control over the data. It is also flexible as well as scalable, which is great for future-proofing the project. Alongside this, PostgreSQL supports advanced features for queries, JSON, functions, expressions and constraints. Even with the extensive features, reliability and flexibility, it does not sacrifice its fast performance and efficiency [3].

3.4 Docker

Docker is a useful tool for software developers as it offers a common machine and environment to work on for the developers of the team. This eliminates the dependency, version conflict, operating system and portability problems. It also offers a scalable platform for your application and makes it easy to deploy on the customers machine as you can just deploy the container. As our group utilizes different operating systems and may use different versions of the code, Docker is going to be beneficial for us [4].

3.5 Github

Version control is a critical issue in software development and GitHub is the most common and efficient platform for developers to merge their work without disrupting the workflow of others. It also enables the programmers to see who committed which part of the code when and direct the questions they have or the problems that emerge to the owner of the code. This tech is going to be used in file management and version control in our project in order to prevent data losses and sync up each other's work in a controlled environment [5].
